Question 1

Correct

Marked out of 3.00

Flag question

Write a program to read two integer values and print true if both the numbers end with the same digit, otherwise print false. Example: If 698 and 768 are given, program should print true as they both end with 8. Sample Input 1 25 53 Sample Output 1 false Sample Input 2 27 77 Sample Output 2 true

Answer: (penalty regime: 0 %)

```
1 #include <stdio.h>
2 int main(){
3     int a,b;
4     scanf("%d %d",&a,&b);
5     a = a%10;
6     b = b%10;
7     if (a == b){
8         printf("true");
9     }
10    else {
11        printf("false");
12    }
13 }
```

	Input	Expected	Got	
✓	25 53	false	false	✓
✓	27 77	true	true	✓

Passed all tests! ✓

Question 2

Correct

Marked out of 5.00

Flag question

Objective

In this challenge, we're getting started with conditional statements.

Task

Given an integer, *n*, perform the following conditional actions:

- If n is odd, print **Weird**
- If n is even and in the inclusive range of **2** to **5**, print **Not Weird**
- If n is even and in the inclusive range of **6** to **20**, print **Weird**
- If n is even and greater than **20**, print **Not Weird**

Complete the stub code provided in your editor to print whether or not n is weird.

Input Format

A single line containing a positive integer, n .

Constraints

- $1 \leq n \leq 100$

Output Format

Print **Weird** if the number is weird; otherwise, print **Not Weird**.

Sample Input 0

3

Sample Output 0

Weird

Sample Input 1

24

Sample Output 1

Not Weird

Explanation

Sample Case 0: $n = 3$

n is odd and odd numbers are weird, so we print **Weird**.

Sample Case 1: $n = 24$

$n > 20$ and n is even, so it isn't weird. Thus, we print **Not Weird**.

Answer: (penalty regime: 0 %)

```
1 #include <stdio.h>
2
3 int main(){
4
5     int n;
6     scanf("%d",&n);
7     if ( ((n%2)==1) || ( ((n%2) == 0) && ((n >= 6) && (n<=20)) ) ) {
8         printf("Weird");
9     }
10    else if(((n%2)==0) && (((n>= 2) && (n <= 5)) || (n > 20))){
11        printf("Not Weird");
12    }
13
14 }
```

	Input	Expected	Got	
✓	3	Weird	Weird	✓
✓	24	Not Weird	Not Weird	✓

Passed all tests! ✓

Question 3

Correct

Marked out of 7.00

Flag question

Three numbers form a Pythagorean triple if the sum of squares of two numbers is equal to the square of the third. For example, 3, 5 and 4 form a Pythagorean triple, since $3^2 + 4^2 = 25 = 5^2$. You are given three integers, a, b, and c. They need not be given in increasing order. If they form a Pythagorean triple, then print "yes", otherwise, print "no". Please note that the output message is in small letters. Sample Input 1 3 5 4 Sample Output 1 yes Sample Input 2 5 8 2 Sample Output 2 no

Answer: (penalty regime: 0 %)

```
1 #include <stdio.h>
2 #include<math.h>
3 #define max(x,y) (x) > (y) ? (x) : (y)
4 #define min(x,y) (x) > (y) ? (y) : (x)
5
6 int main(){
7     int a,b,c,sum = 0,second = 0,maxi = 0,mini = 0;
8     scanf("%d %d %d", &a,&b,&c);
9     sum = a+b+c;
10    maxi = max(max(a,b),c);
11    mini = min(min(a,b),c);
12    second = sum-(maxi+mini);
13    if (pow(mini,2)+pow(second,2) == pow(maxi,2)){
14        printf("yes");
15    }
16    else{
17        printf("no");
18    }
19
20
21 }
```

	Input	Expected	Got	
✓	3	yes	yes	✓
	5			
	4			
✓	5	no	no	✓
	8			
	2
